TITLE: The effect of oxidation inhibitors on the gas-stability of oils

SOURCE: IVUZ. Neft' i gaz, no. 12, 1965, 68-70

TOPIC TAGS: GAS ABSORPTION
transformer oil, oxygen consumption, oxidation inhibition ~~transformer oil~~

ABSTRACT: The effect of inhibitors (ditertiarybutylparacresol - 0.2%, paraoxydi-phenylamine - 0.02%, and -oxyquinoline 0.5%) on the evolution or absorption of gases by four different transformer oils (subjected to a silent discharge in air at 30C and a field strength of 2.6 kv per mm at 100 Hz) was investigated. The physical properties of the oils are tabulated, and the experimental results are presented graphically (see Fig. 1). The introduction of inhibitors to highly purified oils has no effect on their gas-stability but does increase their resistance towards oxidation. It is concluded that nothing is gained by the addition of inhibitors to transformer type oils used in hermetically closed conditions. However, addition of inhibitors to high-voltage cables having a liquid oil filler does offer interesting possibilities.

TITLE: An Analysis of the Rotary-Percussion Drilling of Blast Holes in Hard Rocks (Issledovaniye vrashchatel'no-udarnogo bureniya shpurov v krepkikh porodakh)

PERIODICAL: Gor'nyy zhurnal, 1958, Nr 10, pp 32-38 (USSR)

ABSTRACT: The authors compared the efficiency of drilling blast holes in hard rocks with the rotary-percussion drilling machines built by the German firms Nusse and Grefer; Salzgitter and Hausher, with the efficiency of drilling with perforators ~~KT~~ M-4, PRS-3m and P M -508. The authors give a detailed description of the German machines and their performances. They found that the speed of drilling under favorable conditions was much higher than with perforators, but this difference decreased in hard rock drilling operations. Special rotary-percussion drilling machines with increased percussion power must be built for hard rocks. The tested machines can be used for drilling in rocks of a hardness

TITLE: Measurement of the Natural Radioactivity in Human Organs
(Izmereniye yestestvennoy radioaktivnosti v organakh cheloveka)

PERIODICAL: Doklady Akademii Nauk SSSR, 1959, Vol. 125, No. 1, pp. 208-209
(USSR)

ABSTRACT: During the past years the interest in investigating the influence exercised by small doses of ionizing radiation upon living organisms has increased. The radioactivity mentioned in the title is one of the permanently acting factors upon human and animal organism. It is due to several isotopes which are parts of all organs and tissues:

K^{40} , C^{14} , Ra^{226} , etc. As a result of nuclear-weapon tests the radioactivity in man has somewhat increased. The following fission products entered his body:

Str^{90} , Ca^{45} , J^{131} , and even more C^{14} from H-bomb explosions. The present paper gives data on the natural radioactivity of the human organs which were obtained by measuring them. For this

Card 1/1

Measurement of the Natural Radioactivity in Human
Organs

SOV/21-125-1-57/47

purpose served the method of counting suspensions in the scintillating gel (Refs 1-2). Table 1 gives a small part of the results available of healthy man. At the same time table 1 provides data concerning the β -radiation due to K^{40} . As it can be seen from this the entire β activity exceeds the activity caused by K^{40} by averagely 20-30%; this percentage sometimes amounts to 70-90%. Measurements of the γ activity of several organs have shown that the additional radioactivity is on the whole caused by Cs^{137} which penetrates the human organism as a result of nuclear-weapon-tests by the well-known biological course: soil - plant - animal - man. The results obtained give evidence as to the fact that the hitherto produced contamination activity penetrates all human organs and tissues. There are 2 figures, 1 table, and 2 references.

TITLE: The use of an external standard in the determination of the efficiency and background of liquid scintillation counters

PERIODICAL: Pribery i tekhnika eksperimenta, no.3, 1962, 55-58

TEXT: The usual method of determining the efficiency of liquid scintillators for beta-particles involves the introduction of an external standard source which is dissolved in the scintillator. This method is said to suffer from the disadvantage that it involves the switching off of the high-voltage supplies and other operations which may affect the photomultiplier amplification and light collection. In order to avoid these difficulties the authors have used an external standard (a gamma-ray source). The gamma rays are Compton-scattered and give rise to a continuous spectrum of Compton electrons which is analogous to the beta-spectra of the specimens introduced into the scintillator. Thus, if the beta-spectrum of a given isotope and the Compton spectrum due to the external source are recorded under
Card 1/2

The use of an external standard ...

S/120/62/000/003/009/048
2032/E114

identical conditions, then the spectra can be used as calibration curves in subsequent determinations of beta-ray efficiency with the aid of the external standard. The external standard can also be used to simplify background determinations. This is done by determining the background counting rate as a function of the counting rate due to the external standard in a preliminary experiment. The method has been used to estimate the absolute activity of ^{14}C in biological specimens. There are 3 figures and 1 table.

TITLE: Adsorption of micro-amounts of cesium on ftoroplast-4, polyethylene, and glass from aqueous solutions of sodium tetraphenylborate

SOURCE: Radiokhimiya, v. 7, no. 6, 1965, 703-710

TOPIC TERMS: adsorption, cesium, aqueous solution, polyethylene plastic, glass, sodium compound, teflon, desorption, intermolecular complex, ion exchange, biochemistry

ABSTRACT: Adsorption of cesium from aqueous solutions onto polyethylene and ftoroplast-4 [Soviet Teflon] drops sharply when sodium tetraphenylborate is added. Cesium adsorbed on the surface of polyethylene and ftoroplast-4 is readily desorbed by acetone and nitrobenzene. Liquids with low dielectric constant (benzene and ether) are poor desorbants. On the basis of adsorption and desorption data, it can be proposed that on the nonionogenic hydrophobic surfaces of polyethylene and ftoroplast-4, cesium is present as a complex with a tetraphenylborate anion. In complex solutions containing specific organic anions, adsorption of alkaline cations on nonionogenic hydrophobic surfaces is possible. This process can be of special significance in biological systems. If organic anions exist in biological systems which specifically interact with

TITLE: Use of cylindrical optics to increase the luminosity of spectral apparatus with electron-optical amplifiers

PERIODICAL: Pribory i tekhnika eksperimenta, no. 1, 1963, 116-117

TEXT: Cylindrical optics were used for projecting the spectrum from a ДСФ-8 (DSF-8) spectrograph onto the photocathode of an electron-optical amplifier. Two identical cylindrical quartz lenses were arranged at right-angles to each other so that the first lens increased the spectral dispersion by 8 to 12 times, while the second lens decreased the height of the spectrum by ~ 8 times, i.e. from 12 mm down to ~ 1.5 mm. This enabled the full height of the spectrum to be focused onto the photocathode of the electron-optical amplifier. The apparatus was used for measuring the change in contour with time of the 4047 Å line from a РК-4 (PRK-4) mercury lamp. A time resolution of 0.1 μ s was obtained. There are 2 figures.

TITLE: The Application of ¹⁴Mineral Ceramic Tools in Mass Production

PERIODICAL: V sb.: Reziyie mineralokeram. instrumentami, Moscow, Sborongiz, 1958, pp 85 - 90

ABSTRACT: The author describes the experience of the Podol'sk Mechanical Plant, which had introduced mineral ceramic cutting tools (MC) for lathe operations in shops with series production. It is pointed out that, in comparison with the VK2 and VK3 cutters, the application of MC resulted in an increased efficiency and durability; moreover, MC increased the smoothness of the machined surface by one class. The following measures, warranting the introduction of MC have been taken: designs of MC have been developed together with the technological process of fastening the plates on the tool holder, the sharpening and grinding of MC was organized on a grinder of the plant's own design. It is pointed out

Card 1/2

The Application of Mineral Ceramic Tools in Mass Production

69353
30V/123-59-19-78493

that the sharpening of MC resulted in an increased consumption of abrasive disks. In connection with this, the expediency of using tools with mechanically fastened cup-shaped reversible plates is emphasized. Nine figures.

TITLE: Utilization of Mineral-ceramic TsM-332 for Grinding Cast Iron Parts (Primeneniye mineralokeramiki TsM-332 dlya obtochki chugunnykh detalей)

PERIODICAL: Mashinostroitel', 1958, Nr 5, pp 32-33 (USSR)

ABSTRACT: Over the past two years, mineraloceramic tips have been introduced in the Podol'skiy mekhanicheskiy zavod imeni Kalinina (Podol'sk Mechanical Plant imeni Kalinin) replacing cutting tools with tips of hard alloys. The new tip is used for rough as well as finish grinding. As a result of this innovation, production time has been lowered from 0.57 to 0.21 minutes, while efficiency has been doubled and wear resistance increased 20 times. Figure 1 shows the tips 12 x 12 fastened in 2 different ways in the tool holder: - one is cemented, the other is fixed by mechanical means. Figure 3 shows a machine for grinding tips; there is one grinding wheel at either end of the spindle, one for rough, the other for finish grinding. The grinding of one face

Card 1/2

Utilization of Mineral-ceramic Tsk-33 for Grinding Cast Iron Lints

117-36-5-11/21

of the tip is accomplished in 15 seconds. Since the new tips have been adopted in the Podolsk Plant the output of sewing machine flywheels has been increased to 2,000 flywheels per shift. The shaping of the tip is done in the process of production in the form press; grinding of the tip is reduced to lapping of the front face on a boron carbide iron disc. Figure 2 shows the latest conical-shape cup type held in the tool by means of a center screw round which the tip is turned to change the cutting edge. The Podolsk Sewing Machine Plant is using this cutting tool on a copy-turning lathe. There are 3 figures and 1 table.

TITLE: Success in using a bridge train

SOURCE: Voyenny vestnik, no. 1, 1966, 84-88

TOPIC TAGS: military bridge, floating bridge

ABSTRACT: Over bridges made of pontoon bridge trains, tanks and other heavy caterpillar drive machines can move in columns at speeds of up to 30 km/hr, at the same distance apart as on roads. It has often been observed, however, that drivers increase the distance between machines on a bridge, and the column becomes too long. In addition, at the approach to the exit at the opposite bank, the rate of movement of the column decreases, particularly when the exit is badly equipped. In movement on a bridge at minimum distances, there should be no danger from the chance approaching of neighboring machines. Machines of the maximum allowable weight should follow one another at distances of up to 10 meters. The article proposes new designs (illustrated) for bridge

TITLE: Spectra of photoneutrons from platinum, bismuth, lead, and uranium

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 5, 1964, 1906-1908

TOPIC TAGS: photoneutron, neutron spectrum, gamma neutron reaction, platinum, bismuth, lead, uranium

ABSTRACT: The photoneutron spectra from platinum, lead, bismuth, and uranium were measured with a linear accelerator by the time-of-flight method. Targets of natural isotopic composition were bombarded by 16MeV electrons. The neutrons were counted by a fission chamber located 35 meters from the target at 90° to the electron beam. In the photoneutron spectra from bismuth and lead, two groups

Card 1/4

ACCESSION NR: AP4037610

of neutrons show up clearly in addition to the evaporation spectrum (in the regions 1.3--3 MeV and >3 MeV. The deviation from the statistical distribution above 3 MeV, observed by many authors, is apparently due to the contribution of the direct interaction of γ quanta with neutrons in different nuclear shells. The authors believe that the neutron peak at 1.3--3 MeV is due to single-particle transitions from excited levels of the compound nucleus, which are possible in the excitation region ~ 10 MeV. TITLE: Experiment in formulating hydrodynamic forecasts for a period up to ten days

SOURCE: Mirovoy meteorologicheskij tsentr. Trudy, no. 5, 1965. Dinamika atmosferykh dvizheniy planetarnogo mashtaba i gidrodinamicheskij dolgosrochnyy prognoz pogody (Dynamics of atmospheric movements on a planetary scale and hydrodynamic long-range weather forecasting), 41-54

TOPIC TAGS: hydrodynamics, weather forecasting, approximation method, stability criterion, atmospheric movement

ABSTRACT: A baroclinic, two-dimensional, linear atmospheric model is formulated for the purpose of predicting weather conditions. As a basis for the analysis, quasi-solenoidal equations of the spatial problems on a sphere are used at 700 and 300 millibars. Linearizing the equations relative to the zonal flow stream function, one has

$$\left[\frac{\partial}{\partial t} + \alpha_1 \frac{\partial}{\partial \lambda} \right] \left[\Delta \psi'_1 + \frac{1}{r} (\psi'_3 - \psi'_1) \right] + \left[2(\omega + \alpha_1) - \frac{1}{r} (\alpha_3 - \alpha_1) \right] \frac{\partial \psi'_1}{\partial \lambda} = 0$$

Card 1/3

L 20976-86

ACCESSION NR: AT5024855

$$\left[\frac{\partial}{\partial t} + \alpha_3 \frac{\partial}{\partial \lambda} \right] \left[\Delta \psi_3 - \frac{1}{\Gamma} (\psi_3 - \psi_1) \right] + \left[2(\omega + \alpha_3) + \frac{1}{\Gamma} (\alpha_3 - \alpha_1) \right] \frac{\partial \psi_3}{\partial \lambda} = 0$$

where ψ_1 and ψ_3 are stream functions signifying departures from the zonal magnitudes at levels of 300 and 700 millibars, and α_1 and α_3 are circulation indices at these levels. The stability criteria for the problem are given by

$$\frac{\alpha_1 - \alpha_3}{\omega} < 2\Gamma = 0.037.$$

The solution of these equations for ψ_1 and ψ_3 is obtained in double series in terms of spherical harmonics. In the analysis, the following geostrophic approximation is used $\psi = (g/f)H$, H - altitude of the isobaric surface. The forecast analyses were made in two regions. One, in latitude band $\theta = 20-50^\circ$, $\lambda = 0-350^\circ$, the other in $\theta = 20-50^\circ$ and $\lambda = 30^\circ$ west longitude to 110° east longitude. The duration of the forecast was up to ten days. The results are given in tabular form as the ratio of mean absolute error to the mean variability. In addition, an absolute topographic forecast was made for various days in 1964 (May 7-15) and maps

Abstract: hour. Full dispersion of flies took place after 3 days. Migration went on with stops in unpopulated areas. *F. terraenovae*, *F. domestica*, *F. stabulans* and others migrated long distances through marshes and waste lands. The migration went mostly toward animal breeding sovkhoses, subsidiary farm barnyards, to yards of food establishments which were in unsanitary conditions, groceries and houses. The main direction of the migration was toward Leningrad. -- A. S. Adrianov.

TITLE: Extractive method for separating rare earth elements for their
subsequent determination

SOURCE: Zhurnal analiticheskoy khimii, v. 21, no. 9, 1966, 1058-1063

TOPIC TAGS: rare earth metal, metal extracting

SUB CODE: 11

ABSTRACT: Results are presented of investigations of conditions required for ex-
traction of rare earth elements with butyric acid, and also on the use of this
extractive method for separation of rare earth elements from other elements.

The experiments were conducted with solutions containing the elements of the
cerium group (40 % Ce_2O_3 , 25 % La_2O_3 , 25 % Nd_2O_3 , 10 % Pr_2O_3), elements of the
yttrium group (50 % V_2O_5 , 20 % Yb_2O_3 , 10 % Ho_2O_3 , and 5 % each of Gd_2O_3 , Dy_2O_3 ,
 Er_2O_3 , and Lu_2O_3), with solutions of elements from both groups, and also with so-

Card 1/2

1032 0410

ACC NR: AP7011822

lutions of several rare earth elements. In all cases, complete extraction was achieved when optimal conditions were met.

In addition to speed (15-20 minutes), this method is precise since only one extraction is used. This fact led to the proposal of a method of concentrating small ($n \cdot 10^{-2}$ - $n \cdot 10^{-3}$ %) amounts of rare earth elements from ores. This method was verified with silicate ores. Orig. art. has: 1 figure and 4 tables. [JPRS: 40,361]
